

## synapse integrated security solutions

how secure is your business-critical data?

synapse has developed a uniquely holistic view of information security based on enterprise architecture expertise and secure application development. We work closely with some of the leading organisations in the financial sector, helping them to meet both their business objectives and their regulatory requirements.

### effective perimeter security

synapse delivers multi-layer enterprise-class solutions meeting the varied demands of the financial services industry. We make security easily available and affordable by providing a broad range of security products and services – either for in-house deployment and management, or as a fully managed service.

As networks become increasingly more complex, businesses need to ensure that all endpoints, including servers, laptops, and handhelds, are protected by up-to-date security software. We integrate multiple security products such as anti-virus, firewall, network access control, and anti-spyware into a comprehensive and easily managed solution. This gives businesses a holistic view of their network, simplifies management and optimises security.

The proliferation of portable devices means that normal network boundaries have become blurred, and people now effectively mark the network perimeter. This has led to an increase in data leakage and breaches. In the light of increasing regulatory control, businesses should continually review their security policy against their strategic goals, and the sensitivity of their data against their in-house capabilities.

### rigorous internal control

The rapidly evolving threat to security is creating significant risks which businesses must manage more effectively. All systems that are used to exchange or store information are vulnerable to attacks on customer data, loss of intellectual property and phishing – as well as threats from internal sources.

Customers must protect themselves against these risks across all e-mail, instant messaging, Web communications, file sharing, and other information systems within the enterprise.

synapse provides a framework for consistently enforcing content control across the enterprise, from e-mail gateway security to archiving. This framework actively protects against data loss and policy violations as well as enabling customers to respond rapidly if any problems occur.

We deliver industry-leading protection for messaging and collaboration systems, while lowering the total costs of data retention, electronic discovery and systems management.

### compliance and security management

security teams are faced with managing complex IT environments that include many diverse systems and security devices. They must provide effective and transparent management in line with their company's security policy, as well as compliance with both internal mandates and external regulations.

With tight budgets, organisations must determine whether they have the security expertise and resources to manage their own IT environments.

We help you to manage your IT security environment proactively, and demonstrate that effective, well managed IT security controls are in place.

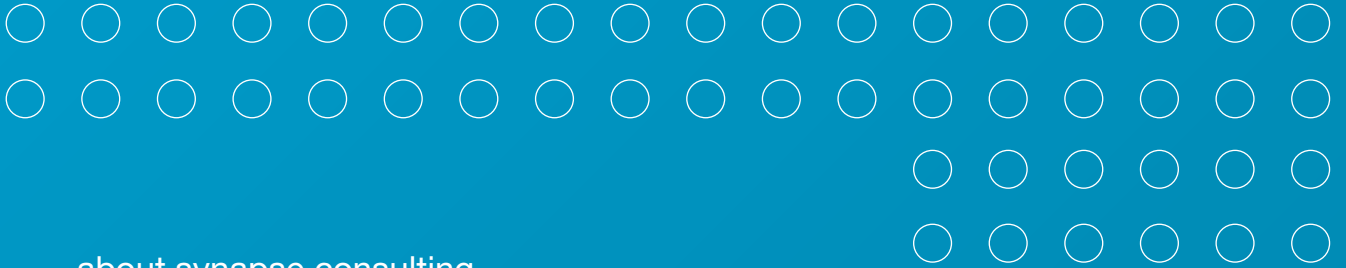

You can use our security and compliance management software:

- With your own in-house staff
- With our consultants
- As a fully outsourced managed security solution
- Or as a combination of all three
